

■ Gürteks business processes configured by Netsis

Strengthening all of its supply, logistics, sales and financial processes with Netsis solutions, which exactly match the company's needs, Gürteks has achieved considerable increase in productivity, thus increase in profitability. The company further acquired the flexibility to access its production and cost information in an accurate and fast way. Many of the processes were improved while their operations continued and error margins were minimised.

The Gürteks Group, which extended its activities into the international markets, has made a name with the export prizes it has received. By renewing in the internal regulations, Gürteks made the decision to support its standard financial system with new systems. The importance of this project was the records of more than ten companies which are affiliated with the company would be centrally consolidated, thus data flow speed and systematic operation be raised to the highest level. Considering its sectoral experience, short installation period, fair budget and utilisation advantages, Gürteks has chosen to work with Netsis to in process.

In the project, Gürteks's supply, logistics, sales and financial processes were supported with the Netsis solutions which accurately matcher the company's needs. The company's general ledger operations were improved with the installation of the Production and Cost Accounting Modules, which successfully consolidated the records of more than ten companies of the Gürteks Group within a central system.

Substantial productivity increase

Before the implementation of the project, the affiliated companies recorded their data separately in their individual systems. The reporting process would require overtime, the data in the different systems comprised discrepancies. The project collected all of the entities in a single database

and enabled automatic consolidation. The problems, which were encountered in the previous system, for example, the mismatch that occurred between the goods on hand and the legal reports when invoices were received late, were resolved by the capability to record all documents instantaneously.

While only certain type of reports could be prepared in the previous system, today the number of the report types, which Gürteks can use, is limited to its imagination. On the other hand, seldom errors which occurred in transfer orders are entirely abolished through the systems compatibility with online banking operations.

Another advantage over the previous system is the opportunity which the remote desktop connection function has provided to employees –all employees can now work from home. Only one employee at a time could take the data home and work. Because the system was not integrated employees would enter duplicate data. With the introduction of the integrated system, the data is recorded only once, thus time saved.

Data collection time reduced to seconds from days

"What are the quantities on hand?" While in the previous system reports had to be separately obtained from all departments to answer this question, today, it takes only seconds to get this information with the inventory onhand report.

It was a difficult process to record and monitor operations when twenty individual accounts had to be defined for the different orders of one customer whereas the customer paid these at once. The Project Code system resolved this issue outright and facilitated access to information.

The current accounts and ledger account, which could not be compared in the previous system, can now be compared with the use of a single key; any errors can be instantaneously identified. The inability to reflect the general production and personnel costs to the costs caused problems. Now, with this project, the net costs can be monitored.

In the production department, on the other hand, every data would be recorded in a separate Excel sheet. It would not be possible to associate this data to get information. The project has facilitated the information access of the production department. Today, all transactions can be created by only processing the finished ods records and all information can be accessed any time, from any point.

Because the costs would be cursorily calculated in the previous system, the price calculation would not accurately identify the net values of the unit costs according to the month's foreign currency exchange. Since the net costs can be calculated in the new system, accurate pricing and unit costs can now be calculated.

Established control over work processes

The system has prevented the errors caused by duplicate records. Moreover, group-based rights authorisation was accomplished; thereby every group can now execute and report the processes under its responsibility via the computer. It is now furthermore possible to get reports on how many records every user has entered in the Netsis system.

Unlike the previous system, updates in the Netsis system are processed online, thus operations can be processed without interruption even after hours.
