

■ The İzmir Metropolis Municipality achieved its goal with Netsis

The primary reason for İzmir Metropolis Municipality in choosing Netsis was, the earlier programmes they used could not provide standardisation, caused delays in technical support, provided inaccurate reports and duplication of data, thus the need for an integrated system that would consolidate their operations.

The İzmir Metropolis Municipality has chosen to work with Netsis to migrate to an integrated structure that consolidates its eleven companies with the purpose of ensuring the integration of their financial data in every aspect.

The İzmir Metropolis Municipality authorities stated that the executive staff and Municipal management would now be able to base all of their short-, medium- and long-term management decisions on fast, reliable and integrated data as a result of their collaboration with Netsis.

The authorities of the İzmir Metropolis Municipality explained that the programmes that they had earlier used did not provide standardisation. Delays in technical support, inaccurate reports and duplicate data in the companies were the problems they encountered. Municipal authorities stressed their consequent need for an integrated system that would consolidate their operations.

What were the system goals that are now achieved with Netsis?

The objectives of the integrated

financial system of the İzmir Metropolis Municipality (IBB-EMS) were to strengthen the communication within the company as well as with other companies, ensure the flawless operation of the business processes, abolish confusion of information, facilitate the application of the changes in the business process to the system, and eventually ensure the ability to get reports in all required formats.

In addition to the above-defined goals, a shared solution was developed for the ten companies of the municipality, each active in a different field; the solution was thus implemented in the diverse activity fields from transportation to urban planning, from engineering to energy production, from human resources to fair organisations.

The Municipality authorities indicated that seven of these ten companies had been already running Netsis solutions, the three of them, which were previously using other solutions, have also decided to work with Netsis. They further stressed that the solution is already launched in most of the companies. Specific human resources operations at İzelman

and the fuel pump integration operation at İzbeton, for instance, have been successfully implemented through the efficient usage of the basic modules.

The developer of this system that has been specifically designed for the operations of the municipal companies, who work for the welfare of the city's residents, is Ünibel A.Ş. The System Management Group of Ünibel AŞ has doubtless played an important role in accomplishing the collaboration between the Municipality and Netsis.

The project was implemented also with the contributions of Diyez Yazılım, whose involvement in the Fusion transition operation of each municipal company has enabled the data conversion. Diyez Yazılım has also cooperated with Netsis to support the analysis, modelling and adaptation operations in the companies by consolidating the company data in a single database.

With the implementation of this system, which was developed under the management of Ünibel A.Ş.'s Systems Manager Mert Tuna, the İzmir Metropolis Municipality launched many practices that will provide the residents of İzmir with full services. Mr. Tuna indicated that the system, which is designed to yield maximum efficiency in services, could be developed with additional software, signalling the expansion of the implementation.
